

RNA overview

RNA is reactive due to its 2' OH group

RNA is the first read-out of the genetic information

RNA is more than a messenger, RNA 'interprets' the genetic information

RNA is processed, which changes the readout of the genetic information

RNA can have enzymatic activity

RNA is structural more diverse than DNA

Proteins have evolved that stabilize the structure of RNA

Literature: The RNA World, Cold Spring Harbor Press 2005

Structure of RNA and DNA

What are the differences between RNA and DNA structures?

Types of RNAs

Where do RNAs come from?

What are the differences between DNA and RNA polymerases?

What do all RNAs have in common?

Tiling array data /ENCODE project: 93% of DNA in the ENCODE region is transcribed Birney et al., 2007, Identification and analysis of functional elements in 1% of the human genome by the ENCODE pilot project. Nature 447, 799-816.	VS	Most of this RNA is in regions coding for proteins Bakel et al. PLoS Biol. 2010 May 18;8(5):e1000371.
---	----	--

Most RNAs are noncoding:

Ribosomal RNA, 60S, 20S		Protein synthesis, Ribozyme
tRNA (transfer)		Protein synthesis,
tiRNA (tiny),		Fragments from tRNAs, block translation
tiRNAs (transcription induced)		Associated with promoter, RNA polII backtracking, nucleosome marking
snoRNA (small nucleolar) C/D Box		Guide for RNA methylation
snoRNA (small nucleolar) H/ACA Box		Guide for RNA pseudouridination
sdRNAs, psnoRNAs snoRNA derived RNAs, processed snoRNAs		Unclear, some work in alternative splicing
snRNA (small nuclear)		RNA processing
snRNAs, SM class (Stephanie Smith)		Pre-mRNA splicing
snRNAs LSM (Like sm)		Pre-mRNA splicing (U6 associated), RNase P processing
miRNAs		Regulate translation (and more) 20-23 nt
siRNA		Small interfering RNAs 22 nt
piRNA (piwi interacting, Piwi (P-element induced wimpy testis in <i>Drosophila</i>))		Male Germline, 26-31 nt long
Long nc RNAs (non coding)		Chromatin structure (Xist)

mRNAs are coding

mRNA (messenger)		Encodes protein
------------------	--	-----------------

Types of RNAs

This list is growing due to better analysis techniques

a

Diagram illustrating the formation of a cyclic pyrophosphate intermediate from a linear pyrophosphate structure. The reaction involves the deprotonation of the 3'-OH group of the sugar moiety (A:G+1) by a base (:B), leading to the formation of a cyclic intermediate (shown in brackets) where the phosphate groups are bridged by an oxygen atom. This intermediate then loses a proton (H:B+) to form the final cyclic pyrophosphate product.

The diagram illustrates the two-step transesterification process of pre-mRNA splicing:

- Step 1: First Transesterification**
 - The 5' splice site (AG) and branch site (A) are shown.
 - The branch site adenosine (A) acts as a nucleophile, attacking the 5' splice site phosphorus.
 - This results in the formation of a **lariat intermediate**, where the 5' end of the intron is covalently linked to the branch site.
- Step 2: Second Transesterification**
 - The 3' splice site (AG) is shown.
 - The 5' splice site adenosine (A) acts as a nucleophile, attacking the 3' splice site phosphorus.
 - This results in the formation of the **mRNA** (5' Exon AG - 3' Exon) and the **lariat intron**.

What happens if a single-stranded RNA binding protein binds to the G>T region?

RNA can be catalytic active: Ribozymes

Principle: form 'stable' RNA structure,
Use 2' OH as a reactive group

Annu. Rev. Biochem. 2000. 69:597–615

RNA, the first macromolecular catalyst: the ribosome is a ribozyme Thomas A. Steitz¹ and Peter B. Moore¹, TIBS

More example of ribozymes

Table 1 Naturally occurring ribozymes and ribonucleoprotein enzymes

Ribozyme	Sequenced examples	Size (nt)	Activity (reaction product)
Hammerhead	11	40	Self-cleavage via transesterification (2',3' cyclic phosphate)
Hepatitis delta virus	2	90	
Hairpin	1	70	
Varkud satellite	1	160	
Group I intron	>1,500	210	Self-splicing via transesterification (3'-OH)
Group II intron	>700	500	
RNase P*	>500	300	Pre-tRNA processing via hydrolysis (3'-OH)
Spliceosome* (U2+U6 snRNAs)	70, 50	180, 100	RNA splicing via transesterification (3'-OH)
Ribosome* (23S rRNA)	>900	2,600	Peptidyl transfer (amide)

Number of sequenced examples is a snapshot as of 2002 and is influenced by DNA-sequencing strategies and database upkeep; it may provide a rough indication of relative abundance. RNAs in any group vary in size; the size provided here indicates the lower end of the length distribution for the natural examples. See www.ma.icmb.utexas.edu and www.jwbrown.mbio.ncsu.edu/RNaseP/.

*Ribonucleoprotein enzymes. RNase P: bacterial and archaeobacterial RNAs have the relevant activity in the absence of protein. Spliceosome: U2 and U6 small nuclear RNAs (snRNAs) alone show an activity related to the natural activity. Ribosome: no activity has yet been observed with protein-free, large-subunit rRNA.
